ST14 wt Allele

National Cancer Institute

Source

National Cancer Institute. *ST14 wt Allele*. NCI Thesaurus. Code C50376.

Human ST 14 wild-type allele is located within 11q24-q25 and is approximately 51 kb in length. This allele, which encodes suppressor of tumorigenicity 14 protein, is involved in the cleavage/activation of other proteases and latent growth factors. Decreased expression of the ST 14 gene is associated with tumor metastasis.
