The review is quite comprehensive, but can the title be rephrased to “Ethnobotanical Study of Yerba Mate Usage in Syria”? These findings can inform sustainable practices, support conservation efforts, and contribute to a broader appreciation of ethnobotanical diversity. This ethnobotanical study can serve as a bridge between Syrian consumption practices and global conservation efforts, highlighting ways to support both cultural continuity and ecological integrity.

The study could reveal specific data on Yerba Mate’s demand in Syria, potentially influencing sourcing policies to prevent overharvesting in native South American habitats. This data can inform policymakers about the need for fair-trade certifications or sustainable sourcing agreements with South American producers, aligning with conservation goals to protect native Yerba Mate forests.

The study’s documentation of Yerba Mate usage in Syria can thereby contribute meaningful insights and practical guidance for creating environmentally responsible practices that align with both local values and broader conservation goals.
