The article is interesting on the use of platelet derivatives and fibrin. There are a few points that I think should be added to the article to make it more complete and robust:

1. In the patient selection table, I think it's important to provide information on the type of bisphosphonate used, the route of administration and the length of time these drugs have been used.
2. Another interesting point is the AAOMS classification of bronj cases, as well as information on the clinical size of the lesion.
3. What are the postoperative imaging criteria at all times?
4. I suggest updating the references, they are old, and there are more current ones that can be used to support the article.
