This paper explores a very interesting topic: the impact of indoor environmental conditions on students' performances.

- The literature review is not enough, since only one paper has been cited. The other articles mentioned in the Bibliography are not referenced in the manuscript, but they should be cited there.
- The methodology section is not complete. More technical information about the indoor conditions is required: What is "high temperature" or "moderate temperature"? What is a "noise classroom" or a "bright classroom," etc.?
- Again in the methodology, please specify the kind of tests used to explore cognitive functions and the questionnaire structure with some examples of questions. Also, please provide a definition of academic performance and how it was tested.
- Results should report data analysis. Since the experimental set-up has different variables (temperature, noise, light), results should report on the impact of each environmental characteristic on students' performance, not only on noise.
