Potential competing interests: No potential competing interests to declare.

In the introduction it is mentioned that little research has been done on the phenomenon in adolescents. It is necessary to specify the importance of studying the phenomenon in this population, saying that it is because it has not been studied is not enough.

Specify in the methodology that the study design is non-experimental

In inclusion criteria, specify the required age range.

The methodology must specify with sufficient clarity the ages for each of the stages of adolescence that appear in Table 1.

In the discussion it is necessary to further explain the differences found. Similarities and differences with other results are explained, but there is not enough discussion with the differences.

The discussion is too brief and is insufficient for all the results presented.

The conclusion is too long, it needs to be more concise.
