The article presents a proposal for an algorithm determining the stability or affinity of a certain complex network. An attempt was made to use the Facebook friendship network to illustrate how the algorithm works.

I have mixed feelings about the presented results. In particular, I lack proper motivation, justification and actual use of the semiring concept. The example presented does not convince me that the algorithm works equally well for other networks.

In my opinion, the article in its current form is not suitable for publication. However, proper refinement (including typography) can result in the creation of quite an interesting article.
