**Potential competing interests:** No potential competing interests to declare.

The article discusses the potential impact of artificial intelligence (AI) on humanity, drawing parallels to the science-fiction film "Forbidden Planet" and raising concerns about the rapid development of AI. It addresses various aspects, including the potential for AI to render humans impotent in activities that define our humanity, such as creating art and literature, as well as the ethical and existential implications of AI's advancement. The author emphasizes the need for psychologists to adapt to this "posthuman" world and allocate resources to address the challenges posed by AI. The article also raises questions about the nature of AI intelligence and the ethical treatment of AI "persons." The article would have benefited from a logistical section outlining all infrastructure that enables broad-scale adoption of AI technology in day-to-day life and how new technological upgrades may be required for broader societal adoption of AI in the home. The author could also delve deeper into the virtual absence of national borders and how virtual communities will organize or isolate individuals. Overall, it presents a thought-provoking analysis of the profound impact of AI on human society and the ethical dilemmas it poses.
