Male infertility due to large-headed multiflagellar polyploid spermatozoa

INSERM

Source

INSERM. (1999). Orphanet: an online rare disease and orphan drug data base. Male infertility due to large-headed multiflagellar polyploid spermatozoa. ORPHA:137893

Male infertility due to large-headed multiflagellar polyploid spermatozoa is a male infertility due to sperm disorder characterized by the presence, in sperm, of a very high percentage of spermatozoa with enlarged head, irregular head shape, multiple flagella, and abnormal midpiece and acrosome. It is generally associated with severe oligoasthenozoospermia and a high rate of sperm chromosomal abnormalities (polyploidy, aneuploidy).
