Potential competing interests: No potential competing interests to declare.

The article presents an examination of the intersecting challenges faced by Egypt in the realms of climate change, energy, and food security. While the article provides a thorough overview of the issues at hand, there are notable areas that warrant critical consideration. Firstly, the methodology section lacks detailed discussion, particularly regarding the selection of data sources and the rationale behind the chosen models and scenarios. This omission raises questions about the reliability and validity of the study's findings. I believe it would benefit from a more nuanced analysis of the socio-economic factors shaping Egypt's energy and food sectors, including the role of governance, policy frameworks, and international cooperation. The discussion on the impacts of climate change tends to focus heavily on quantitative projections, overlooking qualitative dimensions such as social vulnerability and adaptive capacity. The article should delve deeper into the socio-environmental implications of energy transition strategies, particularly in a context where energy security and economic development are closely intertwined.
