Potential competing interests: No potential competing interests to declare.

A research study focused on Analytical Study and Amelioration of Plastic Pavement Material Quality

Please provide a thorough discussion on the potential sources of errors in the experimental procedures. A more explicit analysis of systematic and random errors related to the Analytical Study and Amelioration testing and data recording processes is needed.

The basic information regarding the solid waste used must go in the methods, not the results section.

The nomenclature is incomplete, and the equation parameters need to be included.

The conclusion states that the study evaluated the Three-point bending test merges features.

However, the role and contribution of polyethylene terephthalate in the study are not discussed in the manuscript.

Elaborating on the specific applications of AI, such as data analysis or model optimization, would enhance the clarity of the methodology and its relevance to the study.

Present the findings clearly and in an organized manner. Utilize subsections or bullet points to emphasize important findings from the research.

Provide quantitative results or statistics to support statements about the study.
