**Potential competing interests:** No potential competing interests to declare.

The manuscript fails to provide a clear methodology for how artificial intelligence (AI) is integrated into decision-making for diabetic patients during Ramadan. This omission undermines the credibility of the proposed approach and leaves readers questioning the feasibility and effectiveness of the suggested interventions.

While the manuscript references previous studies and guidelines, it lacks empirical evidence or case studies to support its assertions regarding the efficacy of AI in managing diabetes during Ramadan. Without concrete data or examples, the claims made remain speculative and unsubstantiated, diminishing the manuscript's scientific rigor.
