Review of: "Computationally Optimized ctDNA Surveillance for Recurrence Detection in HPV-Positive Head and Neck Squamous Cell Carcinoma"

Smriti Panda¹

1. All India Institute of Medical Sciences, India

Excellent manuscript highlighting the importance of integrating Ct DNA testing into existing follow-up strategies. The methodology mentions performing sensitivity analysis based on never-smoking or ever-smoking status. However, the results of the above sensitivity analysis were not presented in the results.

Overall, the quality of the methodology and presentation of results is excellent.

Highly relevant to head and neck oncologists.
