Pemphigus foliaceus

INSERM

Source

INSERM. (1999). *Orphanet: an online rare disease and orphan drug data base*. *Pemphigus foliaceus*. ORPHA:79481

Pemphigus foliaceus is a rare superficial pemphigus disease characterized by multiple, pruritic, scaly, crusted cutaneous erosions, with flaky circumscribed patches, localized mostly on the face, scalp, trunk and extremities, often presenting an erythematous base. Mucosal involvement is rarely observed.
