Dear Editor,

A comprehensive and beautiful study has been conducted, and I congratulate the researchers. However, it is appropriate to publish it if the following points are taken into consideration.

It is not appropriate to talk about improvement targets in a business where no records are kept.

Most goat breeds are local breeds, and putting pictures of goats to better understand the morphological features increases visibility.

It would be useful to give descriptive values of the productivity characteristics (reproductive characteristics, live weight, viability, milk yield, etc.) obtained in previous studies on these breeds grown in the country.

Disease resistance was determined based on what? What was the criterion?

How was the environmental compliance criterion determined?

Solution suggestions need to be more concrete and enlightening.

They need to be supported with ideas for management and nutrition strategies.

According to this study, the researcher is expected to give advice on the breeds suitable for the regions and the number of animals in the herd size.

Breeding buck and goat stations can be created.

Best regards.
