Potential competing interests: No potential competing interests to declare.

In their commendable review article, the authors delineated their investigative approach towards understanding the factors influencing Electric Vehicle (EV) adoption in India. While employing a deductive approach to unravel the unfolding of these factors in developed nations, the authors also emphasized their applicability in developing countries. Furthermore, they adeptly employed an iterative application of the inductive-deductive approach, resulting in the development of a taxonomy that categorizes these factors into micro-, macro-, and meso-level antecedents. The application of this taxonomy, as highlighted in the article, is laudable and stands out as a valuable framework. It has the potential to serve as an organizational tool for systematic and cohesive initiatives aimed at promoting EV adoption in developing countries. Additionally, the article accentuates the significance of tailoring these factors to align with the distinctive infrastructural, economic, and market requirements characteristic of developing nations.
