The work, "A narrative review on the management of severe COVID-19 infection using stem cell-based therapies with a focus on the registered clinical trials", was sent to me for review.

I found the article very interesting. It is well written in general and has broad coverage of aspects of this kind of management of COVID-19 patients. However, with other articles in the literature and some clinical trials in my country, I am convinced that these approaches of cell-based therapies have been proven useless, especially in severe cases.

The conclusions are concise but very precise, pointing out the weak aspects of the literature reports about this particular treatment methodology.
