Potential competing interests: No potential competing interests to declare.

The review describes in full detail the state of the art in what concerns saponins and efficient treatments against two major pathogens: *E.coli* and *Staphylococcus aureus*. It is easy to read and nicely structured. I think it brings a lot of good information for further applicative research. It can be published in its current form and also, we suggest to emphasize more on alternative therapies for antimicrobial resistance (why it is important to adress them , the extent and level of resistance found in these two bacteria isolated from food products).
