Potential competing interests: No potential competing interests to declare.

I suggest that the author begins the review in a broader context, discussing semi-arid regions scattered around the world. In fact, considering this is a review article, having this broad perspective makes it more robust. Integrated Watershed Management (IWSM) has already been discussed worldwide. What advances have been achieved? What are the success stories? And in failures, what was the main problem, or what were the major issues? Afterward, the author can introduce a case study. I recommend using flowcharts, tables, and figures to make the text more engaging. As it stands, it is too extensive. To assist in an excellent and comprehensive literature review, has the author considered using bibliometric analysis? In times of climate change, semi-arid regions have received significant attention in research. This work could become magnificent for those interested in watershed management.
