Potential competing interests: No potential competing interests to declare.

The article is written in a clear and accessible manner, making it easy to read and comprehend. Although the methodology employed is not groundbreaking, this research effectively highlights the significance of beef cattle fattening in the most underserved rural areas. It constitutes a noteworthy contribution to the scientific literature, particularly in elucidating the factors such as farm size, treatment, and feed cost that play a pivotal role in determining the profitability of cattle fattening in Bangladesh.

In the section detailing the methodology, it would be beneficial if the authors could provide further clarification on their specific definitions of primary and secondary data. Additionally, a more elaborate discussion on the implications of their findings for the enhancement of production costs in each of the studied regions would enhance the depth of their argument.
