The research on "Factors Influencing the Intention to Choose Transportation Applications in Bangkok, Thailand" appears to be quite intriguing; however, I have some constructive comments to offer. After carefully reviewing this article, it seems that I have yet to identify a clear research gap and supporting data for the research phenomenon. Additionally, the results of the validity test are not apparent, despite the fact that both validity and reliability testing are crucial elements in quantitative research of this nature.

*Firstly*, it would be beneficial to establish a more distinct research gap or problem statement at the outset of the study. This would help the reader better understand the significance and relevance of the research. Without a well-defined research gap, it becomes challenging to appreciate why this study is conducted in the first place.

*Secondly*, the absence of validity testing results is a significant concern. In quantitative research, ensuring the validity of the research instruments is essential to guarantee that the data collected accurately measures the intended constructs. The article should include a detailed description of the validity tests performed and their outcomes to instill confidence in the research findings.
