Review of: "The Development of Differentiation-Based Therapy for Breast Cancer Using EDAR and XEDAR Signalling Pathways: A Conceptual Framework"

Busayo Akodu¹

1. Southern Illinois University-Edwardsville, United States

This is an intelligent and well-thought-out perspective on drug development for cancer therapy. It would be interesting to see this concept tested in the lab.

I suggest you provide a more detailed account of the EDAR/XEDAR signaling pathways, both diagrammatically and in writing, by showing the interactions involved and the amino acids that played major roles. This is the bedrock of your perspectives, and so a more detailed account will enable a better understanding of the rationale behind your concept.

You can also include the structural differences between EDA-A1 and EDA2.

Additionally, make punctuation corrections and adjustments where necessary, especially in your proposed strategies.

You should also reference the facts stated under 'Theoretical Basis for Therapeutic Intervention' and in any other relevant sections.
