Digital extensor muscle aplasia-polyneuropathy

INSERM

Source

INSERM. (1999). *Orphanet: an online rare disease and orphan drug data base. Digital extensor muscle aplasia-polyneuropathy. ORPHA:2926*

Digital extensor muscle aplasia-polyneuropathy is a rare, hereditary motor and sensory neuropathy characterized by flexion deformities of the thumb and fingers, sensory deficit in the hand and polyneuropathic electrophysiologic findings in the limbs. Operation on the hands reveals extensor muscles and their tendons to be absent or hypoplastic. There have been no further descriptions in the literature since 1986.
