The idea and work is appreciated. They worked and compared the energy policies and supply of their own country i.e. Nigeria with one of the most developed country UK. It seems to be very difficult to compare the single developed country with other fully developed country. However, their literature is very strong. Also, the details related to the energy policies and usage etc. throughout the year from 1971 to 2020 is well explained. But, they did not use any statistical technique to prove their point. Even though, they used the term descriptive but only graphs are not enough evidence. I will suggest to respected authors to use more descriptive statistics. Also, use any statistical technique to find any difference or relation between the two nations. Lastly, add a brief note on why you are comparing Nigeria with the most developed country and how it will work in future? Thank you
