Potential competing interests: No potential competing interests to declare.

The paper presents a case study on Acacia Pycnantha gum exudates, recognized as a traditional food for consumption up to 30g/day in Australia and New Zealand. This research work is an original and applied approach because it has economic potential in the corresponding field. This allows the sale of the gum for non-food uses in other countries and recognizes the safety of AP gum. This work promotes further research and development to increase the yield per tree and to create demand.

This paper is well-structured and very well written. It looks like highly relevant applied research that meets a crucial need for citizens. The bibliographic references are very recent. In the manuscript, the text is very clear, and the English language is of high quality.

For all these reasons, I recommend this paper without revision for publication in the Qeios Journal.
