Potential competing interests: No potential competing interests to declare.

The theme of the author's article is a current topic.

However, the structure of a scientific article is not followed.

A well-written scientific article must describe the subject covered in great detail: data collection, analyses, major stages of the research, etc.

As rapporteur, this article could not be understood and analyzed.

In my opinion, this paper can only be accepted in a scientific journal after profound modifications:

1- After the summary, you must put the Keywords of the research

2- Follow one of the structures of a scientific article:

- OPERA: observation, problem, experimentation, results,

actions

- ILPIA: introduction, literature, problem, implication,

future

- IMReD: Introduction, Methodology, Results and Discussion

3- Clearly identify the research objectives at the end of the introduction and not before the conclusion

4- Clearly identify the methodology used

5- Even the author's own results and contributions are neither well understood nor clearly identified. There is not even a comparison between the author's results and previous works

6- The bibliography is ordered. However, it is neither rich nor updated (it is 2024). Furthermore, there must be more theoretical work on this issue. This must be completed.
