Potential competing interests: No potential competing interests to declare.

This report explores an intriguing question, but it falls short of being an academic paper. To enhance the study's rigor and depth, I recommend incorporating quantitative analysis. For instance, leveraging mobile sensing technology to capture social distancing behaviors of voters and integrating this data with the number of COVID-19 infections and deaths would allow for an analysis of the impact of voting activities on the transmission of the virus. This approach would provide more robust and quantitative insights into the topic at hand.
