

Review of: "[Commentary] Impact of Total Mastectomy on the Lymphatic Pathway and the Limitation of PET Imaging in Breast Cancer Surveillance"

Komal Rani

Potential competing interests: No potential competing interests to declare.

The author has deliberated upon two significant aspects in the realm of breast cancer; nevertheless, they could not successfully sync both the aspects. The author initiated the discussion with mastectomy and discussed the process thoroughly; however, one can discuss lymphedema in more detail. In the second half, the author discussed the principle of PET in the diagnosis of breast cancer; however, it would have been better if the author could have put an insight on the importance of PET scan in identifying the metastases. It seems all the figures were used from other publications/articles, a practice deemed unfavorable and should have been avoided.

It is my earnest recommendation to the author that they concentrate their efforts on a singular aspect, either the impact of total mastectomy on the lymphatic pathway or the limitations of PET imaging in breast cancer surveillance, and endeavour to elucidate it in a more refined and enhanced rendition.
