Potential competing interests: No potential competing interests to declare.

The concept is really original and interesting. The article is well written,, in my opinion. Nonetheless, the writers might think about addressing the following issues:

1. How can the system be put into practice in a real-time scenario at a reasonable cost?
2. Could you give specific instances or models from other healthcare interventions that could help with this bracelet system's economical implementation?
3. Including a discussion of the idea's actual application rather than just introducing the concept.
4. The author may consider going into further detail on how to interpret the color bracelet during actual patient care. Could you please elaborate on how detailed descriptions of color interpretations could enhance the utility of the bracelet in emergency medical situations?
5. Could you recommend any possible approaches or pilot projects that could aid in assessing how well the color-coded bracelet system works in real-world scenarios
