## **Review of Article named as "Medical students' disease status of COVID-19: A multicenter study"**

1. This article is having general information that is taken by survey on COVID-19 status of medical students from Khyber Pakhtunkhwa in Pakistan, but it is not adding NO "NEW" knowledge to the literature.
2. The survey that was used in this article must be validated. There is no validation knowledge of the self-developed questionnaire which was administered to the students, which contained both open and closed-ended questions.
3. There is lack of knowledge on the way of disease transmission to the medical students. Do they directly deal with Covid-19 Patients during their education in hospital, or community acquired transmission?
4. Which vaccine was applied to the medical students? And is there any case reported as Covid-19 after applying vaccines?
5. Which drugs were used for the treatment of Covid-19 patients especially treated in hospital. And what about the survival of that patients, do they all get well and transferred to ICU and what about the mortality rate?

Please give the answers of the questions asked above by me.

Thank you

Assoc Prof Dr Yakup ARSLAN
