Potential competing interests: No potential competing interests to declare.

In the abstract, consider not using "etc."

I think a figure of the signaling pathways described would benefit the review.

Sections 2.2 and 3.2 need introductory paragraphs and conclusion paragraphs; the information given is succinct and appropriate but seems abrupt without them.

Overall, the article is well prepared, well written, and appropriate in detail. Aside from being slightly difficult to follow without figures guiding you through the effects on the signaling cascades, it is very well done.

I would support publication of this article with the minor suggestion to add signaling cascades figures to help summarize the text descriptions.
