Potential competing interests: No potential competing interests to declare.

This paper discusses the impact of AI on work, creativity, and even death. The psychological consequences of AI are really an interesting topic and worthy to be read, which makes the paper promising to attract readers and scholars and to garner more citations.

The paper is written very well. It is organized and solid. The author's writing style is sophisticated.

The novelty of the topic makes getting references difficult and stands in the way of a robust methodology. The small number of references stresses this downside. The author tries to reflect his own perspective of AI and its futuristic consequences. The author takes on the predictor role to forecast the future of AI on human life and psychology.

In the end, I recommend accepting the paper with minor revisions (increasing the number of citations through close subjects and areas).
