Potential competing interests: No potential competing interests to declare.

Allow me, at the outset, to present to your honorable Excellency to place your trust in me to be with you Titled article" The Impact of Urban Design in minimizing Women's Fear of Crime".

It deals with a very important topic, which is the role of urban design in reducing crime in the urban center and in public places

The researcher was able to control the research from the methodological point of view, and he was able to use a scientific method, which is the IMRAD method

In terms of the scientific approach used, it relied on two main strategies for crime prevention in urban areas, including situational crime prevention (SCP) and crime prevention through environmental design (CPTED).

As for some reservations that we see that if they were taken into account, they would have increased the strength of the research, which are:

The research needs a lot of scientific references and previous experiences that have been approved by many researchers who have excellent results in the field of the impact of public space on human behavior. We mention, for example, Jan Gehl, Lawssan, and Mehta.

Also, the research did not take a single case study, and it was different, and this may affect the results of the research, because the social specificity of women in each case differs from the other.

The search needs some pictures and maps.

The way in which the results of the questionnaire were analyzed requires some statistical means to analyze it to give it the most credibility.

In the end, I wish you success

Dr.walid arab
