

Review of: "Factors Associated with Contraceptive Use Among Migrant Female Head Porters in the Kumasi Metropolis"

Federico Tobar

Potential competing interests: No potential competing interests to declare.

I recommend publishing the article because it seems it contributes to a better understanding of the reasons for the low use of modern contraceptives among a vulnerable population.

A few suggestions on the formal aspect of the paper could be taken in consideration by the authors:

1. The introduction could highlight the research objectives and, even better, announce a research question. This question will be answered directly in the conclusions of the article.
2. After showing the results through tables, it is worth presenting the hypothesis that allows the reader to interpret what explains the use of contraceptives among Migrant Female Head Porters in the Kumasi Metropolis.
3. The session discussion is intended to put the research findings in contrast (or in conversation) with the literature. Even when it seems that there is no background in research about the use of contraceptives among Migrant Female Head Porters in the Kumasi Metropolis, indeed, there will be literature exploring determinants of contraceptive use among vulnerable populations. So it is worth contrasting with them which are the most potent determinants.
4. Even though promoting health coverage extension, testing HIV, and giving better employment conditions to the Migrant Female Head Porters in the Kumasi Metropolis would be desirable outcomes, they are not a direct result of this research. Instead, the article shows a specific population's vulnerability regarding its reproductive and sexual rights. Therefore, what shall be highlighted in the last part of the article is what the government can consider once will be enough political will to improve access to modern contraceptives for Migrant Female Head Porters in the Kumasi Metropolis.
