This article could be interesting because support the hypothesis of a protective role of testosterone against COVID-19. However, although it is well known that there is a different immune behavior sex-related against various diseases, in my clinical practice treating patients with COVID-19 (over 500 patients), I have not seen a better progress of the disease in the men compared to women, and I don't remember seeing studies that support this conclusion. I believe that the manuscript should be strengthened by means of a more thorough analysis of the scientific literature on this topic.
