The concept of research presented in the current article is remarkably sound and as per the recent research.

Following are my observations:

1. The abstract is precisely describing the content of the manuscript.
2. The presentation of the mathematical model is well-defined.
3. The execution of mathematical treatment on the governing equations is commendable.
4. The results obtained are satisfied by the governing initial and boundary conditions proposed in the manuscript.

Overall the manuscript is acceptable however I have the following issues with the present manuscript:

The introduction section shall give more details on the research carried forward in the laser treatment of human skin.

The similarity index of the article must be as per the journal standard.

I will strongly recommend the present article for publication subject to the above couple of revisions.
