Potential competing interests: No potential competing interests to declare.

While the work provide a comprehensive overview of the study on ICT resource management, it's essential to acknowledge potential limitations to ensure a nuanced understanding of the research. Here are some limitations of the work:

1. A through proofreading is suggested due to lots of grammatical and typo errors is suggested.

2. The overall article organization is not presented in the introduction.

3. The study may not cover every aspect of ICT resource management due to constraints in scope. Certain specific technologies, emerging trends, or industry nuances might not be addressed.

4. Findings and recommendations may not be universally applicable. The study might focus on specific types of organizations, industries, or geographical regions, limiting the generalizability of the results.

5. Given the rapidly evolving nature of technology, the study might have a limited shelf life. Recommendations and insights may become outdated as new technologies emerge or industry practices evolve.

6. Limitations in terms of time, budget, or access to certain organizations could affect the depth and breadth of the research. This might impact the richness of the case studies and the diversity of perspectives considered.

7. The study may be influenced by the authors' perspectives and assumptions, potentially introducing bias. Assumptions made about the general state of ICT resource management or the impact of certain technologies could affect the validity of the findings.

8. The availability and quality of data might pose challenges. If the study relies heavily on self-reported data or data from a limited number of sources, there could be concerns about accuracy and representativeness.

9. The study might focus predominantly on the technological aspects of ICT resource management, potentially overlooking organizational or cultural factors that play a crucial role in successful implementation.

10. The perspectives of key stakeholders, such as end-users, IT professionals, or organizational leaders, might not be adequately incorporated. This could impact the comprehensiveness and applicability of the proposed recommendations.

11. The study might not anticipate unforeseen challenges or disruptive factors that could influence ICT resource management. External events, economic shifts, or global crises might have implications not considered in the study.

12. Ethical considerations, such as the impact of certain technologies on privacy or data security, might not be thoroughly explored. The study could benefit from a more in-depth analysis of ethical implications associated with ICT resource management.
