This research study was developed to evaluate collaborative researches on artificial intelligence according to 3 main criteria. The evaluation of this collaborative concept together with the main criteria such as Complementarity, Shared objective, Sustained interaction gains importance in terms of human-computer interaction relationship. I congratulate the researchers for their valuable work.

I have some suggestions to contribute to the study. In the methodology section, it is seen that certain keywords are also used to narrow down the fields of research. However, it seems more logical to include Figure 1 in the methodological process for the review of the studies. In addition, as a suggestion, if this conceptual review and classification process (based on 3 main criteria) can be added with bibliometric analysis or graphical expression, the classification and evaluation process related to keywords can become more valuable.

In addition, it is important to include the narratives in the limitations section together with the methodology narrative in terms of the progress of the initial study as a whole and to achieve narrative integrity.
