This is an interesting subject which is very important to the biological researches as the accuracy of the studies using these data highly depends on these kind of data. Very important topic need to be studied very carefully. Results and experimental designs are well written. However,

- There is a lacking in the usage of reference. This is a very sensitive topic. Literature support is very important in this area. Better to cite important statements.
- Also literature review part looks very short here. It is better to do a comprehensive literature study on this area and the state of the art performance of this study.
- As the findings are very strong and sensitive references and citations are very important.
- It is better to restructure the article. Conclusion is before the discussion. Materials used in this study is not well explained.
- Also it is better to briefly explain the protocols compared in this study.
- Discussion part looks like the author is not that much confidence about few aspects. It is better to re-write this section.
- On the whole, it needs a major revision before considering for publication.
