Potential competing interests: No potential competing interests to declare.

The strength of the study is the good number and the lack of data available for the defined population. The design for a cross-sectional study is fairly good. However, the information derived is quite well-known. Longitudinal studies among those with poorly controlled diabetes could have been followed up, and sugar control and lipid levels could have been correlated later with the improved control of diabetes. This can be accepted in view of the well-designed study in a defined population about which studies are scarce.
