This work is good because it gives us a reminder that cervical cancer still remains a public health issue. I thought it remarkable how the author uses two main ways to reassess the strategies for preventing this kind of cancer in the UK. The first strategy that I would like so much is the health belief model because it is centered on the behaviour of a person. Because it helps health workers to understand how beliefs and attitudes impact health behaviour related to public health issues. The second is a population perspective that is so interesting for the main reason that it points to cervical cancer not only as a public health issue in the UK but also as a global health problem. I think the article is nice to read and very easy to understand. I would suggest only improving the way to develop the methodological part of this research. For example, for a comparative analysis, I would expect a comparative table to show us as readers which perspectives are included in the analysis.
