The area of research selected by the authors "Crime Prevention Through Environmental Design (CPTED)" is very important as it gives an opportunity to architects for taking into consideration consciously the certain factors which helps in the prevention of crime by following certain design solutions.

My concern with the submitted research article is authors need to clearly identify the parameters and corresponding indicators through extensive literature study.

The shortlisting of parameters and indicators can be done separately for micro (house) and macro level (township).

Further the discussed case studies can be demonstrated how safe they are against the crime by putting the values of indicators.

The same can be validated through opinion survey.
