Dear Editor,

This is a narrow mini-review manuscript on Herbal Treatments and Male Fertility.

1: In the PRISMA chart, the article numbers that have been removed at each level should be specified.

2: As has been determined in the studies, many herbal medicines are effective on male fertility, but the important issue is the active substance of these drugs, which requires HPLC and determining the type of effective substance.

3: The history of surgery such as varicocelelectomy and the use of fertility drugs is also important, which is not included in the inclusion and exclusion criteria.
