

# Review of: "The Psychological Impact of Leisure and Rehabilitation Activities in Children With Autism: A Delphi Approach"

Fahad Ahmed<sup>1</sup>

<sup>1</sup> Queen Mary, University of London

Potential competing interests: No potential competing interests to declare.

The article is consistent; however, some improvements will definitely benefit the study explained in this article:

1. It is not clear how the author came up with the set of activities listed.
2. In certain places where standardized techniques like the Delphi method are explained, it would have helped to provide some relevant citations.
3. The paper title indicated the target population was children with autism, but the pilot study actually involved adolescents (ages 10-19, according to the [WHO](#)).
4. More population demographics and details about their preferences and physical abilities, autism level, etc., would have made their findings more robust; for instance, it is not clear if an ASD child will be emotionally engaged with a physically demanding leisure activity if the child is less active physically in its usual routine.
5. The inclusion of a proper conclusion to the paper would have enabled the author to organize the information better and also provide the appropriate flow to suggest future directions better.
