# Trans-Activator Protein BZLF1

National Cancer Institute

## Source

National Cancer Institute. *Trans-Activator Protein BZLF1*. NCI Thesaurus. Code C118473.

Trans-activator protein BZLF1 (245 aa, ~27 kDa) is encoded by the Epstein-Barr virus BZLF1 gene. This protein is involved in the induction of both the expression of early lytic cycle genes and the replication of the viral genome.
