Taurultam

National Cancer Institute

Source

National Cancer Institute. *Taurultam*. NCI Thesaurus. Code C75290.

A reversible metabolite of taurolidine and an amino acid taurine derivative, with antibacterial and antineoplastic activity. Taurultam, like its congener taurolidine, inhibits proliferation of microvascular endothelial cells, although to a lesser extent, by selectively inhibiting the adhesion of endothelial cells to laminin but not to collagen I and fibronectin.
