

Review of: "Diffusely abnormal white matter converts to T2 lesion volume in the absence of acute inflammation"

Mark Steven Freedman

Potential competing interests: The author(s) declared that no potential competing interests exist.

The authors do some interesting work and have compiled quite a bit of detail on 2 cohorts - those with RR and those with progressive disease and have suggested changes that might indicate transitioning patients. A prospective study would be necessary for them to show this since one would want to know how early such changes are seen on MRI vs. when the clinical change is actually noted.
