Review of: Aedes Distribution and Meteorological Effect on Ovitrap Index in Coastal Area of Besut, Terengganu: An Entomological Study

The manuscript requires significant revision before publication. The introduction should clearly state the research objectives at the end, and the Materials and Methods section must include necessary references. The results section needs improvement, particularly regarding the quality of the figures, especially Figure 3, which is unreadable. The discussion should be aligned with the findings, and future implications of the study should be addressed for readers. Abbreviations should be clarified, and updated references incorporated. The conclusion must be precise and related to the findings. Authors should follow the journal's revision guidelines, and the English language quality needs enhancement before submission.
