Dear Authors,

You have done a good job. Here are points for improvement:

Kindly rephrase the title and make it short and simple. For example: Prevalence, Associated Factors, and Perianal Complications During the Puerperium Period - A Cross-Sectional Hospital-Based Study.

The Abstract and Introduction are well written. I suggest you decide to use only "perianal" in all contexts rather than interchanging with "perineal."

I believe there was a need for a written consent even if your study population was not formally educated (although you report only 39% were uneducated). It's allowed to read for them, explain for them, and ask them for a fingerprint as a mode of accepting consent.

I would wish to understand how, when, and by whom the information was collected. Did you have any confounding variables, and how were they controlled?

Due to the presence of different biases in this study, I suggest you add and explain the study limitations.
