Potential competing interests: No potential competing interests to declare.

This consensus document, based on a thorough literature review, provides guidance for the management of MRONJ patients.

I liked the tables of advice which divide patients according to high or low dosage treatments and which class of drugs they have been prescribed for their underlying condition.

One area of potential future research is to look at the success or otherwise of major free tissue transfer for large ON defects, and advice as to who might benefit most from such surgery, and for whom it should be avoided.
