Title: Climate Change and Sustainability: A Comparative Case Study

Overview of the study

Sweden and India have taken differing stances on sustainability and climate change. While India has prioritized striking a balance between economic growth and environmental concerns, Sweden has established proactive policies, such as the adoption of renewable energy and strict carbon reduction objectives. The effectiveness of the International Solar Alliance and other renewable energy initiatives has been assessed. Policymakers and international organizations can use the study's conclusions to craft well-informed strategies for combating climate change and promoting economic growth. Stakeholders may create educated strategies to combat climate change and advance sustainable development by knowing the tactics, policies, and public attitudes. This study brings very significant issues in terms of climate change, sustainability, and experience of different countries. Despite these issues, this study has a greater scope to improve the manuscript.

Major Revisions

1. There is a greater room to improve abstract. The author(s) are requested to summarize the abstract within the word limit 200.
2. Avoid old references. Better to use references since 2019.
3. Theory of change-based conceptual framework is highly required for general readers' better understanding.
4. Please correlate research philosophy like epistemic cognations, or positivism, or other relevant philosophical ground.
5. Show some example and benefits in monetization in each scheme of case studies of Swidden and India.

Minor Revisions

1. There is a lack of cohesion and coherence in the whole manuscript.
2. Proof reading is essential by the professional and native proof readers.
